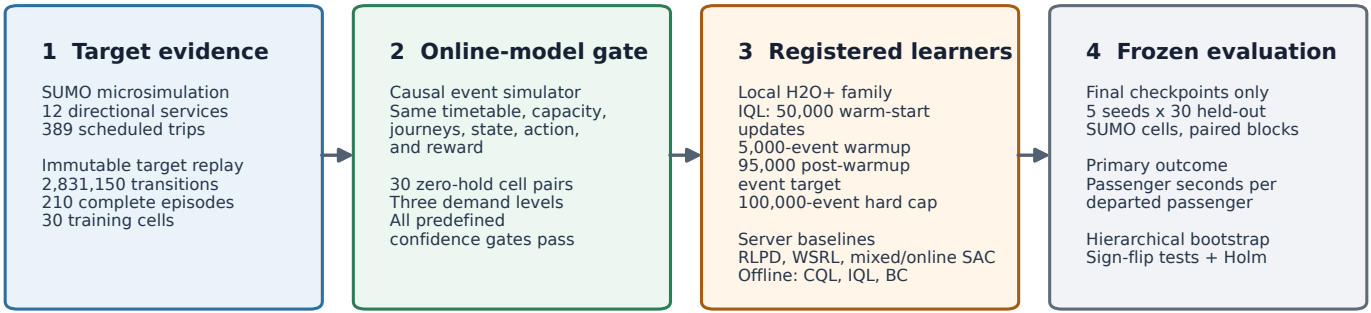
# Registered v6 cross-fidelity evidence chain

One transit contract links immutable target data, online learning, and held-out evaluation



## Protocol invariants

| | |
|---|---|
| **Chronology** | Simultaneous requests are serialized; zero-time tokens do not duplicate cost. |
| **Passenger welfare** | Wait, ride, hold, denied boarding, transfers, and unfinished journeys share one ledger. |
| **Action semantics** | A hurdle policy assigns explicit probability to exact zero hold and density above zero. |
| **Provenance** | Data, simulator, plans, checkpoints, and evaluations are hash-locked and independently audited. |
| **Claim boundary** | Simulator-to-simulator evidence only; policy outcomes require passed execution and evaluation gates. |
